

Introduction to IAM

1. Log in to the AWS Management Console and navigate to the IAM dashboard; take a screenshot of the Users section showing the default view.

ANS

1. Log in to the **AWS Management Console**.
 2. In the search bar, type **IAM**.
 3. Select **IAM (Identity and Access Management)**.
 4. In the left navigation pane, click **Users**.
 5. The Users page will display all existing IAM users (or an empty list if none have been created).
2. Create a new IAM user named InstaUploader and assign programmatic access only. Download the access key file and note where you saved it.

Hint: Do not attach any permissions yet—just create the user and save the credentials.

ANS

1. In the IAM Console, click **Users**.
 2. Click **Create User**.
 3. Enter the user name:
InstaUploader
 4. Select **Programmatic Access** (Access Key) only.
 5. Do **not** attach any permissions or policies.
 6. Click **Create User**.
 7. Download the **Access Key (.csv)** file.
3. Create a group called ContentCreators in IAM, then add the InstaUploader user to this group.

ANS

1. In the IAM Console, click **User Groups**.
 2. Click **Create Group**.
 3. Enter the group name:
ContentCreators
 4. Click **Create Group**.
 5. Open the **ContentCreators** group.
 6. Click **Add Users**.
 7. Select **InstaUploader**.
 8. Click **Add Users**.

4. Write a short explanation (3-4 lines) describing the difference between an IAM user and an IAM role, using an example from any app you use daily (e.g., Zomato delivery agent vs. Zomato app admin).

ANS

IAM User

An IAM User is a permanent identity created for a specific person or application. It has long-term credentials such as a username and access keys.

IAM Role

An IAM Role is a temporary identity that provides permissions for a limited time. It is assumed by users, AWS services, or applications when needed.

❖ **Example**

- Consider the **Zomato** application. A **delivery agent** who logs in every day with their own account is similar to an **IAM User** because they have a permanent identity. On the other hand, when the Zomato application needs temporary permission to upload restaurant images to Amazon S3, it can assume an **IAM Role** instead of storing permanent access keys. This improves security by providing temporary credentials that expire automatically.
