

Cloud Storage Service

1. Create a new S3 bucket in your AWS account with a unique name that includes your initials and the current date (e.g., mybucket-AB-20240618). Set the region to Asia Pacific (Mumbai).

ANS

1. Log in to the AWS Management Console.
2. Search for S3 and open the Amazon S3 Dashboard.
3. Click Create bucket.
4. Enter a globally unique bucket name.
Example:
deepdp-20260718
(Replace this with your own unique bucket name, e.g., deeppatel-20260718.)
5. Select the Region:
Asia Pacific (Mumbai) – ap-south-1
6. Keep the default settings (unless instructed otherwise).
7. Click Create bucket.

Screenshot Required: Bucket successfully created.

2. Upload three different files (an image, a PDF, and a text file) to your new S3 bucket using the AWS Management Console. Make sure each file has a meaningful name related to your favorite app (e.g., instagram-logo.png, spotify-playlist.pdf, zomato-menu.txt).

ANS

- ❖ Upload the following files:

File Type	Example File Name
Image	instagram-logo.png
PDF	spotify-playlist.pdf
Text File	zomato-menu.txt

1. Open your S3 bucket.
2. Click Upload.
3. Select the three files.
4. Click Upload.

3. Set the access permissions on one of your uploaded files so it is publicly accessible via a URL. Test the link in your browser to confirm it works.

Hint: Use the 'Make public' option in the AWS S3 console and copy the object URL.

ANS

1. Select one file (e.g., instagram-logo.png).
 2. Go to the Permissions tab.
 3. Choose Make public (or update the bucket/object policy if required).
 4. Copy the Object URL.
 5. Open the URL in a web browser to verify that the file is publicly accessible.
4. Enable versioning on your S3 bucket, then upload a new version of one of your files (e.g., upload an updated zomato-menu.txt with different content). Check the version history to confirm both versions are stored.

Hint: Use the 'Versions' tab in the bucket to view all versions.

ANS

1. Open your S3 bucket.
 2. Go to the Properties tab.
 3. Under Bucket Versioning, click Edit.
 4. Select Enable and save the changes.
 5. Edit zomato-menu.txt locally (for example, add a new menu item).
 6. Upload the updated file with the same name.
 7. Open the bucket and enable Show Versions to verify that multiple versions of the file are stored.
Result: Both the original and updated versions of the file should be visible.
Screenshot Required: Version history showing multiple versions.
5. Write a short comparison (3-4 sentences) explaining the main differences between AWS S3, EBS, and Glacier. Mention which one you would use for storing Instagram profile pictures, Flipkart order history, and old IRCTC booking records, and why.

ANS

Suitable Use Cases

- Instagram Profile Pictures: Amazon S3 because it provides scalable, highly available object storage with fast access for millions of users.
- Flipkart Order History Database: Amazon EBS because databases require high-performance block storage with low latency for frequent read/write operations.
- Old IRCTC Booking Records: Amazon S3 Glacier because these records are rarely accessed and Glacier provides low-cost, secure archival storage

Feature	Amazon S3	Amazon EBS	Amazon S3 Glacier
Purpose	Object storage for files and media	Block storage for EC2 instances	Long-term archival storage
Access Speed	Fast	Very Fast	Slow (retrieval may take minutes or hours)
Best For	Images, videos, documents, backups	Operating systems, databases, and applications	Archived data that is rarely accessed
Example Use	Website images and user uploads	EC2 boot volumes and application data	Historical records and long-term backups
