

Over View of Cloud Computing

1. Sign up for a free AWS or Azure account and log in to the Management Console. Take a screenshot of your dashboard showing your name or email in the top bar.

ANS :

- 1) Visit aws's site
 - 2) Click **Create a Free Account**.
 - 3) Sign up using your email address.
 - 4) Verify your email and mobile number.
 - 5) Add your payment details (required for verification).
 - 6) Log in to the AWS Management Console.
- Take a screenshot of the AWS Dashboard showing your name or email in the top-right corner
2. In the AWS or Azure Management Console, locate and list 5 key services (such as Compute, Storage, Database, Networking, Analytics). For each, write one line describing what it does and name one real app (like Instagram, Zomato, Flipkart) that could use it.

ANS :

Service	Purpose	Example Application
Amazon EC2 (Compute)	Provides virtual servers to run applications.	Instagram hosts application servers on EC2.
Amazon S3 (Storage)	Stores files, images, videos, and backups.	Spotify stores music files in S3.
Amazon RDS (Database)	Managed relational database service.	Zomato stores restaurant and user data.
Amazon VPC (Networking)	Creates secure private cloud networks.	Flipkart secures communication between application servers and databases.
Amazon CloudWatch (Monitoring)	Monitors system performance, logs, and alarms.	Paytm monitors server health and application performance.

3. Use the search bar in your AWS or Azure Console to find the S3 (AWS) or Blob Storage (Azure) service. Write down the steps you took to locate it and describe in 2-3 lines how a music app like Spotify could use this service to store user-uploaded files.

ANS :

- 1) Log in to the AWS Management Console.
 - 2) Click the search bar at the top of the page.
 - 3) Type **S3**.
 - 4) Select **Amazon S3** from the search results.
 - 5) The Amazon S3 dashboard opens.
- Spotify could use Amazon S3 to store music files, album artwork, and podcast episodes. S3 provides scalable and durable storage, allowing millions of users to upload and stream content reliably while maintaining high availability.
4. Pick one key characteristic of cloud computing (on-demand self-service, broad network access, resource pooling, rapid elasticity, or measured service) and explain, in your own words, how it benefits users of a popular app you use daily (e.g., Paytm, BookMyShow, IRCTC).

Hint: Think about how these apps handle sudden spikes in users or data.

ANS :

- Rapid elasticity allows cloud resources to automatically increase or decrease based on user demand. For example, during Tatkal ticket booking, IRCTC experiences a sudden surge in users. Cloud computing automatically scales up server resources to handle the increased traffic and scales them back down when demand decreases. This helps maintain fast performance and reduces downtime.
